What are energy storing and return prosthetic feet?

Energy storing and return prosthetic (ESAR) feet have been available for decades. These prosthetic feet include carbon fiber components, or other spring-like material, that allow storing of mechanical energy during stance and releasing this energy during push-off.

Are energy storing and return (ESAR) feet a good choice?

Energy storing and return (ESAR) feet are generally preferred over solid ankle cushioned heel (SACH) feet by people with a lower limb amputation. While ESAR feet have been shown to have only limited effect on gait economy, other functional benefits should account for this preference.

What is energy storing feet?

In so called energy storing feet most of the energy is said not to be dissipated in the material, but stored in the spring mechanism that should release it during push-off. Quantities of energy storage and release, as calculated from gait analysis, are not only dependent on the material

Do energy storing feet have a spring mechanism?

The energy storing feet both show a spring mechanism while the others do not. Since it is generally known that the properties of the shoe (e.g. stiff or supple) influence the properties of the prosthetic foot during walking all subjects were provided with the same brand of supple shoes.

Does increasing prosthetic foot energy return affect walking mechanics?

The usefulness of providing more energy return depends on whether or not that energy transfers up the lower limb to aid in whole body propulsion. This research examined how increasing prosthetic foot energy return affected walking mechanics across various slopes.

What is energy storage and return prosthetics?

Preliminary energy storage and return prostheses incorporated an elastically deflectable keel in the prosthetic foot aspect. This design would store a portion of energy during the impact of stance initiation with a subsequent release during the terminal aspect of stance.

Elastic energy storage and return (ESAR) feet have been developed in an effort to improve amputee gait. However, the clinical efficacy of ESAR feet has been inconsistent, which could be due to inappropriate stiffness levels prescribed for a given amputee. Although a number of studies have analyzed the effect of ESAR feet on gait performance ...

The energy storage device provides the momentum necessary to support electrical output until the engine can start and couple to the synchronous machine. The result is the system behaving as a diesel genset, with the exception that the energy storage device is recharged to allow a seamless transition back to utility after stability is restored.

Dynamic energy storage refers to systems that can rapidly store and release energy in response to fluctuating demands and supply conditions in the power grid.
