How does electric energy storage work in a braking system?

Since the energy storage capacity of battery is much greater than the coil spring, the electric energy storage method always participates in energy recovery throughout the entire braking process. The total recycled energy (E_{sum1}) is the sum of the deformation energy of the coil spring and the feedback energy to the power battery.

What is electro-mechanical braking energy recovery system?

An electro-mechanical braking energy recovery system is presented. Coil springs are used for harvesting the braking energy of a vehicle. The system can provide extra start-up torque for the vehicle. Efficiencies of 0.56 and 0.53 are obtained in the simulation and experiments.

What is braking energy recovery?

Generally, the method of braking energy recovery can be classified into two categories: electrical control strategy and mechanical energy harvesting approach. Electrical control strategy for braking energy recovery has been considered in EVs and hybrid electric vehicles (HEVs).

Where regenerative braking energy is stored?

Generally, all the regenerative braking energy is assumed to be converted and stored in the ESS. However, this is only true when ignoring the main vehicle driving cycles, which falls short in extending the lifespan and reducing the cost of the regenerative braking system of EV.

Can coil springs improve braking performance?

According to these results, it can be predicted that if the stiffness and number of springs increases, the output can be improved further. In addition, the braking performance and elastic potential energy stored in the coil springs can potentially be enhanced, as well as starting torque that these springs provide for the vehicle.

Which control strategy yields the highest braking regenerative energy?

The results of comparing the braking recovery energy of electric vehicles with different braking energy recovery management strategies are shown in Fig. 19. The results show that the IDP control strategy yields the highest braking recovery energy. Fig. 19. The braking regenerative energy for the electric vehicle with different control strategy.
