How does a diaphragm accumulator work?

The diaphragm accumulator consists of two hollow, hemispherical metal sections bolted together at the center. Notice in Figure that one of the halves has a fitting to attach the unit to the hydraulic system; the other half is equipped with an air valve for charging the unit with compressed air or nitrogen.

Can a diaphragm be exchanged in a welded accumulator?

o In welded accumulators the diaphragm is pressed into the lower part before circular seam welding is carried out. By using a suitable welding process and by situating the diaphragm correctly, this ensures that the elastomer material is not damaged when the welding is carried out. It is not possible to exchange the diaphragm.

Accumulator which stores a fluid under pressure and is therefore able to release hydraulic energy. Pressurisation is mainly based on gas pressure (air, nitrogen, &quot;hydropneumatic accumulator&quot;) and, more rarely, springs or weights (spring accumulator, weighted accumulator).The latter is the only accumulator which keeps the pressure constant during withdrawal of the volume.
