

Control and Optimization of Electric Ship Propulsion Systems with Hybrid Energy Storage by Jun Hou A dissertation submitted in partial fulfillment of the requirements for the degree of Doctor of Philosophy ... 1.1.2 Energy Storage Devices for All-Electric Ships6

Stringing together high-frequency keywords, it can be seen that energy management of ships is mainly about design selection, management, simulation and verification of the performance of ship power (propulsion) systems considering new energy devices such as hybrid energy storage and fuel cells to achieve energy saving and emission reduction.

As the shipping industry shifts toward sustainability, marine propulsion systems will play a key role in reducing emissions and improving energy efficiency. Electric propulsion, hybrid ships, and wind-assisted technologies are paving the way for a cleaner future. By embracing these innovations, the maritime sector can meet regulatory ...

The methods to increase energy efficiency and environmental performance of all-electric ships to satisfy such requirements involve integration of energy storage with a ...

power system for pure electric propulsion ship based on battery energy storage system (BESS). To design and configure the pure electric propulsion ship, 2 MW propulsion car ferry was assumed and

With the strengthening of international environmental regulations, many studies on the integrated electric propulsion systems applicable to eco-friendly ship are being conducted. However, few studies have been performed to establish a guide line for the overall pure electric propulsion ship design. Therefore, this paper introduces the comprehensive design of DC ...

There are many benefits of hybrid/electric propulsion systems. As was shown in this article, hybrid electric propulsion, depending on the type of the vessel, can reduce fuel ...

Due to developments in power electronics, electric machines, energy storage and control, electric propulsion and integrated electrical power systems have become major trends for commercial and ...

Abstract: Large power and torque fluctuations on electric ship propulsion systems, due to propeller rotation and waves, can affect the reliability of a shipboard power network and cause ...

The comprehensive design of DC shipboard power system for pure electric propulsion ship based on battery energy storage system (BESS) is introduced and can help design real ships before the system commissioning.

With the strengthening of international environmental regulations, many studies on the integrated electric propulsion systems ...

In the propulsion systems of electric aircraft, the energy density, defined in watt-hours per kilogram, has a direct impact on determining the range and payload capacity of the aircraft (Gray et al., 2021). While conventional Li-ion batteries can provide an energy density of about 150-200 Wh/kg (Dubal et al., 2019), a fuel cell system provides higher specific energy ...

Hou, J., et al. [19] evaluated the interaction of multiple power sources in the ship electric propulsion system with a hybrid energy storage system on the basis of model analysis and revealed the ...

During recent years, optimal electrification of isolated offshore systems has become increasingly important and received extensive attention from the maritime industry. Especially with the introduction of electric propulsion, which has led to a total electrification of shipboard power systems known as all-electric ships (AESs), the need for more cost-effective and emission ...

Index Terms--energy storage, composite flywheel, uninterruptible power supply, electric start, all-electric ship
I. INTRODUCTION The requirement for electrical energy storage is still uncertain as far as possible applications aboard an All Electric Ship. However, estimated zonal energy storage requirements have ranged from 12.5 kWh to 24 kWh [1].

In this paper, we refer to the onboard electrical power system configuration reported in Fig. 1 where the storage device is connected to the DC link of the double-stage power converter which interfaces the propulsion engines to the AC common bus where generators and loads are also connected. The storage device is in turn interfaced to the DC link through a ...

DOI: 10.1016/j.apenergy.2023.121728 Corpus ID: 260985850; Design of an electrical energy storage system for hybrid diesel electric ship propulsion aimed at load levelling in irregular wave conditions

Energy Storage System (HESS) is introduced to the existing on-board electric propulsion system, it interacts with the generator control systems. Without proper coordination, the HESS system and the

ABSTRACT. Electric systems for naval applications create a challenge for the power system associated control. When incorporating loads with a high-power ramp rate within what is essentially an islanded microgrid, energy sources that supplement generators must be used due to the ramp rate constraints of the generators; this is where energy storages play a ...

In order to evaluate the potentials and limitations of battery-electric propulsion for container ships, the economic performances of a conventional diesel combustion engine and ...

The practical mathematical models of flywheel energy storage and ship electric propulsion system were established. Simulation research on the effect of ship electric propulsion system power quality, made by flywheel energy storage, was completed by using the software Matlab/simulink. We have done a lot of simulation experiments on sudden load ...

Integrated power system combines electrical power for both ship service and electric propulsion loads by forming a microgrid. In this article, a battery/flywheel hybrid energy ...

The methods to increase energy efficiency and environmental performance of all-electric ships to satisfy such requirements involve integration of energy storage with a contribution of intelligent power management to optimize power split between various power generation sources; a tendency toward DC power distribution due to eliminating the need ...

capacitor hybrid energy storage system for fuel cell ship," Energy, vol. 197, pp. 117285, 2020. [25] X. Gao and L. Fu, "SOC Optimization-based energy management strategy for hybrid energy ...

From an energy efficiency point of view, the diesel-electric propulsion system enhances the energy efficiency and complies with the required International Maritime Organization (IMO) values, as ...

The energy storage system is an essential piece of equipment in a ship which can supply various kinds of shipboard loads. With the maturity of electric propulsion technology, all-electric ships have become the main trend of future ship design.

of the keys to the application of composite energy storage device in ship electric propulsion system. 2.1 Capacity configuration objective optimization of composite energy storage device for ship electric propulsion system Cost target, load power fluctuation calming target and supply and demand balance target, and its objective function should

Abstract Flywheel energy storage has been widely used to improve the ground electric power quality. This paper designed a flywheel energy storage device to improve ship electric propulsion system power grid quality. The practical mathematical models of flywheel energy storage and ship electric propulsion system were established. Simulation ...

Both ships will be equipped with SiSHIP Blue Drive PlusC advanced diesel-electric propulsion systems and BlueVault battery storage solutions. These technologies will enable the NOAA to optimize loading on variable-speed diesel engines, resulting in fuel savings and a reduction in maintenance and emissions.

Energy storage, both in its electric and thermal forms, can be used both to transfer energy from shore to the ship (thus working similarly to a fuel) or to allow a better management of the onboard machinery and energy flows. ... Design and control of hybrid power and propulsion systems for smart ships: a review of

developments. Applied Energy ...

The methods to increase energy efficiency and environmental performance of all-electric ships to satisfy such requirements involve integration of energy storage with a contribution of intelligent ...

The shipping industry is going through a period of technology transition that aims to increase the use of carbon-neutral fuels. There is a significant trend of vessels being ordered with alternative fuel propulsion. Shipping's future fuel market will be more diverse, reliant on multiple energy sources. One of very promising means to meet the decarbonisation ...

Integrated Electric Drive (IED) is widely recognized as an attractive solution for next generation electric propulsion applications as it decouples ship propulsion from conventional gas turbines ...

In hybrid energy configuration, the energy distribution is mainly done using electric systems. hybrid propulsion systems for the ship can be classified under three different configurations depending on the energy distribution from the energy sources to the propeller; serial, parallel, and combined serial-parallel architectures according to the ...

This paper focuses on the design stage of an electrical energy storage system which is intended to be used to level the power required by ships for propulsion when sailing in irregular seas. Particularly, a preliminary analysis has been carried out aimed at choosing, between two storage technologies namely battery and ultracapacitor, the more adequate ...
