How are battery energy storage costs forecasted?

Forecast procedures are described in the main body of this report. C&C or engineering, procurement, and construction (EPC) costs can be estimated using the footprint or total volume and weight of the battery energy storage system (BESS). For this report, volume was used as a proxy for these metrics.

How many MW is a battery energy storage system?

For battery energy storage systems (BESS), the analysis was done for systems with rated power of 1, 10, and 100 megawatts (MW), with duration of 2, 4, 6, 8, and 10 hours. For PSH, 100 and 1,000 MW systems at 4- and 10-hour durations were considered. For CAES, in addition to these power and duration levels, 10,000 MW was also considered.

How much does a battery cost?

Given the nature of these storage assets, an energy capacity-based cost comparison is used as opposed to a power-based one. The results show that the Li-ion battery has the lowest total annualized \$/kWh cost at approximately \$74/kWh of any of the battery energy storage technologies. This is followed by zinc-hybrid cathode technology at \$91/kWh-yr.

How can electricity storage cost-of-service be reduced?

In the meantime, lower installed costs, longer lifetimes, increased numbers of cycles and improved performance will further drive down the cost of stored electricity services. IRENA has developed a spreadsheet-based "Electricity Storage Cost-of-Service Tool" available for download.
