

Is hydrogen a competitive energy storage technology?

Compare hydrogen and competing technologies for utility- scale energy storage systems. Hydrogen is competitive with batteries and could be competitive with CAES and pumped hydro in locations that are not favorable for these technologies.

Is green hydrogen a viable energy source?

Green hydrogen, produced with renewable electricity, is projected to grow rapidly in the coming years. Many ongoing and planned projects point in this direction. Hydrogen from renewable power is technically viable today and is quickly approaching economic competitiveness.

Can hydrogen be used as a renewable power source?

In conclusion, if hydrogen is deployed at scale this can have significant implications for the power sector, and it opens up additional opportunities for renewable power deployment. Hydrogen production could help reduce curtailment in grids with a high share of variable renewable electricity.

What parameters are important for hydrogen production from renewables?

Three main parameters are critical for the economic viability of hydrogen production from renewables: the electrolyser capital expenditure, the cost of the renewable electricity to be used in the process (levelised cost of electricity, LCOE) and the number of operating hours (load factor) on a yearly basis.
