Realistically, nobuilding air conditioning system operates at 100% capacity for the entire daily cooling cycle. Air conditioning loads peak in the afternoon -- generally from 2 to 4 PM -- when ambient temperatures are highest, which put an increased demand for cooling and electricity.

How much energy do you need to run an air conditioner?

Broadly speaking, the amount of energy you'll need to run an air conditioner depends on your climate, your building, your comfort preferences, and the equipment itself. Local climate: Warmer weather means more energy for cooling. High humidity can play a role, too. Look up your climate zone on the 2021 IECC map below, or on the IECC website.

Example: A 3-ton 18 SEER AC unit runs on 2,000W (you can read that off the charts in the wattage article).

How much electricity does a 1 ton air conditioner use?

Here is the full table on how much electricity 1-ton air conditioners use: Running a 3.5-ton central air or mini-split air conditioner will use anywhere between 1.68 kWh and 3.00 kWh per hour(depends on the SEER rating). If you run a 3.5-ton AC for 8 hours, you will use anywhere from 13.4 kWh to 24.0 kWh of electricity.
