

40. Energy Density Calculation. The energy density gives an idea about how much energy can be stored per unit weight in the battery:  $ED = E / W$ . Where: ED = Energy density (Wh/kg) E = Total energy stored in the battery (Wh) W = Weight of the battery (kg) For a battery storing 5000Wh of energy and weighing 50kg:  $ED = 5000 / 50 = 100 \text{ Wh/kg}$  41.

When evaluating whether and what type of storage system they should install, many customers only look at the initial cost of the system -- the first cost or cost per kilowatt-hour (kWh). Such thinking fails to account for other factors that impact overall system cost, known as the levelized cost of energy (LCOE), which factors in the system's useful life, operating and ...
