How does heat dissipation affect thermal protection?

With the widespread use of electronic devices, heat dissipation and thermal protection issues have attracted attention. High temperatures can lead to failure or even burnout of the circuit boards, which are key parts of electronic devices. Most of the current research uses passive thermal protection based on phase change materials.

Can thermochemical heat storage materials be used to protect electronic devices?

As there is no report on the use of thermochemical heat storage materials for thermal protection of electronic devices, this study investigated the performance of a thermochemical storage material in the thermal protection system of a black box under a very high ambient temperature up to 650 °C.
