While vibratory conveyors are effective in many applications if the required incline angle is 6 degrees or less, any angle beyond 6 degrees requires a belt conveyor. Belt conveyors can be designed to store large volumes of product that can then be slowly fed back into the packaging line. For medium-capacity storage applications, horizontal ...

The rotating resistance of idler rollers in belt conveyor systems occurs due to the friction of the rolling elements in the bearings, the viscous drag of the lubricant and the friction of the contact lip seals. The resistance force typically contributes between 5 to 15% [6,7] of the motion resistance of long horizontal belt conveyors.
