In addition to light element K-edges, transition metal L-edges as well as Li and Na K-edges, which are particularly relevant for energy storage materials, can also be analyzed by soft X-ray photons. Note that few soft X-ray beamlines are currently enabling resonant excitation at the Li K-edge at 55 eV [ 81, 82 ].

Aerogels are 3-D nanostructures of non-fluid colloidal interconnected porous networks consisting of loosely packed bonded particles that are expanded throughout its volume by gas and exhibit ultra-low density and high specific surface area. Aerogels are normally synthesized through a sol-gel method followed by a special drying technique such as ...
