Besides, CAES is appropriate for larger scale of energy storage applications than FES. The CAES and PHES are suitable for centered energy storage due to their high energy storage capacity.

How does energy storage work?

Energy storage can store energy during off-peak periods and release energy during high-demand periods, which is beneficial for the joint use of renewable energy and the grid. The ESS used in the power system is generally independently controlled, with three working status of charging, storage, and discharging.
