Abstract: The paper proposes a generalized energy storage (GES) model for battery energy storage systems (BESS), electric water heaters (EWH) and heating, ventilation, and air ...

Generalized energy storage (GES), encompassing both physical and virtual energy storage, can provide remarkable but uncertain adequacy flexibility. When assessing GES's contribution to resource adequacy, the literature typically considers exogenous uncertainties (e.g., failures and stochastic response) but overlooks endogenous uncertainties, such as self-scheduling in ...

Based on this background, this paper proposes a coordinated scheduling model of generalized energy storage (GES) in multi-voltage level AC/DC hybrid distribution network, ...

Combining VES with traditional narrow sense energy storage (NSES), the concept of generalized energy storage (GES) is proposed and its characteristics are described based on the response ...

This paper presents a generalized battery model (GBM) to describe the flexibility of building loads and energy storage, and develops optimal coordination algorithms to provide ...

This paper proposes a novel capacity credit evaluation framework to quantify the contribution of generalized energy storage (GES) to resource adequacy, considering both ...

Based on this background, this paper proposes a coordinated scheduling model of generalized energy storage (GES) in multi-voltage level AC/DC hybrid distribution network, during which the energy ...

Ref. [10] described a novel energy management strategy for hybrid energy storage systems, when used to supply urban electric vehicles. To minimize the total cost of a hybrid power system, a mathematical model for the configuration of battery energy storage systems was proposed in Ref. [11].

Incompatibility of current electricity market mechanisms based on locational marginal price (LMP) become prominent in power systems with increasing renewable energy (RE) and generalized energy storage (GES), resulting in soaring electricity prices, high costs of balancing RE, etc. To fundamentally solve this problem, we propose a novel substitute energy price (SEP) market ...

Improving the utilization rate of renewable energy and reducing the consumption of fossil energy are important ways for the distributed energy system to achieve clean, low-carbon, and high efficiency goals. However, renewable energy is characterized by randomness and is difficult to be utilized on a large scale. Moreover, regional loads are affected by environmental conditions, ...

In the last decade, a number of severe urban power outages have been caused by extreme natural disasters, e.g., hurricanes, snowstorms and earthquakes, which highlights the need for rethinking current planning principles of urban energy systems and expanding the classical reliability-oriented view. In addition to being reliable to low-impact and high-probability ...

(3) The proposed sizing optimization submodel for the energy station and energy supply network fully utilizes the role of generalized energy storage in improving the scheduling flexibility of low-carbon park-level integrated energy system, thereby reducing up to 5.1 % of the planning total cost and 5.7 %; 10 3 t of carbon emissions of park ...

3 The grid voltage  $v_{ac}$  can, thus, be expressed in the dq-frame as follows:  $v_{ac,d} + jv_{ac,q} = v_{ac}(\cos(\theta_{ac} - \theta_{dq}) + jsin(\theta_{ac} - \theta_{dq}))$  (2) The controller  $K_I(s)$  of Fig. 3 is designed as a PI control, as follows [21]:  $K_I(s) = R_{ac} + sL_{ac} + \frac{1}{sT_I}$  (3) where  $T_I$  is the time-constant of the closed-loop step response. The power balance between the dc and the ac sides of the

The structure of the GES enabled BIES is shown in Fig. 1, which consists of electric boilers (EBs), combined heat and power units (CHPs), micro gas turbine generators (MTGs), PVs, electric energy storage (EES), thermal energy storage (TES), electric loads (e.g., transferable load, curtailable load and uncontrolled load) and thermal load. According to the ...

With the large-scale access of renewable energy, the randomness, fluctuation and intermittency of renewable energy have great influence on the stable operation of a power system. Energy storage is considered to be an important flexible resource to enhance the flexibility of the power grid, absorb a high proportion of new energy and satisfy the dynamic ...

Although renewable energy has the advantages of cleanness and non-pollution, the more the renewable energy penetrate into the power grid, the worse flexibility and stability of the grid will be. Energy storage is the key to improve the stability and utilization of renewable energy. Traditional energy storage systems, such as battery energy storage, have expensive cost and ...

This paper proposes a concept of generalized energy storage (GES) to facilitate the integration of large-scale heterogeneous flexible resources with electric/thermal energy storage capacity, in order to participate in multiple markets. First, a general state variable, referred to as the degree of satisfaction (DoS), is defined, and dynamic models with a unified form are ...

To highlight the advantages of generalized energy storage over traditional energy storage, this paper selects 15-bus network and a modified IEEE 123-bus network as examples. GUROBI 9.0.2 is called in MATLAB 2019a to solve the optimization problems in these two networks. The relative optimality gap is set at 0.01%.
