A major difference between off-grid and grid-tied solar is that storage solutions are optional for grid-tied systems. Because grid-tied systems can store excess energy on the grid for free, they can still use solar energy to fulfill 100% of a building's energy needs with around-the-clock access to power (except when the grid goes down).

How is energy storage connected to the grid

The demand side can also store electricity from the grid, for example charging a battery electric vehicle stores energy for a vehicle and storage heaters, district heating storage or ice storage provide thermal storage for buildings. [5] At present this storage serves only to shift consumption to the off-peak time of day, no electricity is returned to the grid.

Thus all sources of power will be unavailable sometime or other. Managing a grid has to deal with that reality, just as much as with fluctuating demand. The influx of larger amounts of renewable energy does not change that reality, even if the ways they deal with variability and uncertainty are changing. Modern grid operators emphasize diversity and ...
