What are the different types of capacitor energy storage systems?

Capacitor energy storage systems can be classified into two main types: Supercapacitors (also known as electric double layer capacitors, or EDLC) and Ultracapacitors. Supercapacitors store energy by achieving a separation of charge in a Helmholtz double layer at the interface between the surface of a conductive electrode and an electrolyte.

Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
