To increase the efficiency of energy storage systems for applications in wind and solar energy or in the field of electromobility a long service life of storage ...

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the voltages supported and the power flowing.

The discharging depth is defined as the ratio of energy released for cooling the interior to the energy stored in the device, can be used as an indicator for the optimization of the thermal energy storage based cold box. In this work, the liquid fraction of the PCMs inside the cold plates is used to represent the discharging depth.
