

What is a knife switch used for?

In home circuits, knife switches are commonly used to control the power supply to lighting fixtures, outlets, and other devices. Users can use knife switches to open or close circuits, facilitating control of electrical devices. In the field of industrial automation, knife switches are widely used to control circuitry in equipment.

What is electrical knife switch?

Electrical knife switch is mainly made up of moving contact knife, fixed contact knife block, incoming and outgoing line block, these conductive parts are fixed on the porcelain bottom plate. Together with other protective devices: arc-extinguishing chamber, fuse, etc., all covered by an insulating cover.

What is a knife switch housing?

The housing is the external protective shell of the knife switch, used to fix and protect internal components such as the blade, contacts, and operating lever. The housing is typically made of insulating materials to prevent electrical leakage or the risk of electric shock.

How to choose an electrical knife switch?

How to choose a electrical knife switch? There are many different types of knife switches, such as 2 phases knife switch, 3 phase and 4 phases electrical knife switch, regular rated current is 10A~3000A. For ordinary load, the rated current of the knife switch disconnect can be selected according to the rated current of the load;

What is the operating lever on a knife switch?

The operating lever is the part used for manual operation of the knife switch, usually made of insulating materials to prevent electrical leakage or the risk of electric shock. The operating lever is connected to the blade, and pushing or pulling the lever causes the blade to move, controlling the contact state of fixed and moving contacts.

How do knife switches work?

The closing and opening of contacts are controlled by the movement of the blade, allowing users to open or close the circuit as needed. Knife switches are widely used in various low-voltage circuits, primarily for controlling the opening and closing of circuits. Common applications of knife switches include:

A knife switch is a type of switch used to control the flow of electricity in a circuit. It is composed of a hinge

which allows a metal lever, or knife, to be lifted from or inserted into a slot or jaw. The hinge and jaw are both fixed to an insulated base, and the knife has an insulated handle to grip at one end. Current flows through the switch when the knife is pushed into the jaw.
