State-of-charge and state-of-health are different parameters that can sometimes be confused. The aim of this article is to clearly define each term and explain its value and use.  $\text{SoC}$  = State-of-charge. The state of charge of a battery describes the difference between a fully charged battery and the same battery in use.

The energy stored in a battery, called the battery capacity, is measured in either watt-hours (Wh), kilowatt-hours (kWh), or ampere-hours (Ahr). The most common measure of battery capacity is Ah, defined as the number of hours for which a battery can provide a current equal to the discharge rate at the nominal voltage of the battery.

Use the Battery.Parameters object to define the battery equivalent circuit parameters. Battery.Parameters objects are contained in the Battery.PulseSequence and Battery.Pulse objects. The pulse sequence estimation sets some of the Battery.Parameters properties. You can override the properties by manually setting the properties.
