C. Mobile energy storage Consider a fleet of K mobile energy storage units. We denote the charging and discharging operation of storage unit k in time period t by $u_k(t)$, with the convention that $u_k(t) > 0$ models charging and $u_k(t) < 0$ models discharging. We assume each storage unit starts empty at the beginning of the

Aisles between rack units increase your space requirements. Mobile rack units are an effective solution and can achieve space savings of up to 90%. In this system, an aisle is opened by pushing apart the racks only where you need to gain access. The technology behind this: mobile racks that are mounted on electrically driven bases ("carriages").

In contrast, mobile storage only discharges energy on demand, and can do so instantly; they don't need to idle at all. This can dramatically lower energy costs, especially combined with their ability to charge off-peak at 10-15 cents per kWh. Beyond fuel savings, mobile storage batteries require much lower maintenance than diesel generators.
