

Oil and gas field energy storage

Can depleted oil & gas wells be used for energy storage?

The idea is to use depleted oil and gas wells as a reservoir for the storage of compressed natural gas. As needed, the gas can be released to spin a turbine and generate electricity. The reservoir is recharged using excess electricity from the grid and the cycle repeats, providing a potential solution for the growing demand for energy storage.

What is energy storage in decommissioned oil wells?

Energy storage in decommissioned oil wells entails using these wells to store a variety of forms of energy, including thermal, pumped hydro, and compressed air. The idea is to utilize the wells' subsurface reservoirs to store energy during times of excess supply and release it during times of high demand (Matos et al., 2019).

Does a depleted oil & gas field have long-term hydrogen storage?

Long-term and large-scale hydrogen storage is examined in a depleted oil and gas field. A real full-field simulation model with site-specific parameters was used. Preferred targets for seasonal hydrogen withdrawal were identified. Effect of the cushion gas nature, its composition and structural geometry were assessed.

Why do oil and gas companies need underground geological storage?

As reported by the 2002 EPRI study, one probable reason is the need for underground geological storage, which is likely perceived as a risk by utilities. However, this should not be an issue to the oil and gas sector, with vast experience storing hydrocarbon-based fuels in underground reservoirs.

What is underground gas storage?

There is a need to study the gas mixtures underground for storage. The concept of underground gas storage is based on the natural capacity of geological formations such as aquifers, depleted oil and gas reservoirs, and salt caverns to store gases.

What are the benefits of offshore energy storage solutions?

The benefits of developing offshore energy storage solutions are not limited to the decarbonisation of the oil and gas industry. The shipping industry presents the opportunity for energy generation and consumption offshore (e.g., in the form of hydrogen or ammonia), locally generated by offshore renewable energy sources (RES).
