Not only are lithium-ion batteries widely used for consumer electronics and electric vehicles, but they also account for over 80% of the more than 190 gigawatt-hours (GWh) of battery energy storage deployed globally through 2023. However, energy storage for a 100% renewable grid brings in many new challenges that cannot be met by existing battery technologies alone.

Europe's largest battery storage project, the 100-megawatt system in Minety in Wiltshire, South West England, is now fully operational. Controlled and optimised by Shell-owned Limejump, the battery will help balance the UK's electricity demand, providing electricity for up to 10,000 homes for a day before being recharged.

Even nanostructured Si electrodes have demonstrated stable electrochemical performances in lithium-ion batteries (LIBs), complex process and high-cost of nanostructured Si electrodes are far from industry standards. Thus, utilization of commercially available low-cost Si microparticles with high-performance is highly necessary for high-energy-density LIBs.
