The most common type of supercapacitors is electrical double layer capacitor (EDLC). Other types of supercapacitors are lithium-ion hybrid supercapacitors and pseudo-supercapacitors. The EDLC type is using a dielectric layer on the electrode - electrolyte interphase to storage of the energy. It uses an electrostatic mechanism of energy storage.

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.

The expression in Equation ref{8.10} for the energy stored in a parallel-plate capacitor is generally valid for all types of capacitors. To see this, consider any uncharged capacitor (not necessarily a parallel-plate type). At some instant, we connect it across a battery, giving it a potential difference (V = q/C) between its plates.

...where: E is the energy stored.; C is the capacitance, which tells us how much charge the capacitor can hold.; and V is the voltage, which is kind of like the pressure of the water in our tank.; An important thing to note: If you double the voltage (increase the pressure), the energy stored goes up by four times. That's a big jump!

Supercapacitors are the type of capacitors in which energy storage is based on charging and discharging processes at the electrode-electrolyte interface [34].
