What is lightning & how does it work?

Lightning is a dazzling natural phenomenon that occurs when electrical imbalances between the Earth's surface and the atmosphere are discharged through a brilliant flash of light, accompanied by the unmistakable roar of thunder. This awe-inspiring event, while fleeting, packs an enormous amount of energy within its electrically charged bolts.

What can triggered lightning do for material processing?

Material processing via triggered lightning is limited to techniques that utilize rapid discharges, e.g., metal and glass preprocessing of materials, waste volume reduction, biomass energy conversion, where current prices make plasma-arc processes prohibitive.

Does energy harvesting work on lightning?

And another describes energy harvesting as it relates to smart systems but is not working on lightning per se except on a sensor array for detection. The author found no work being carried out matching lightning energy with energy harvesting. Lightning strikes are plasma phenomena, i.e., the dielectric breakdown of air forms a plasma channel.

A technology capable of harvesting lightning energy would need to be able to rapidly capture the high power involved in a lightning bolt. Several schemes have been proposed, but the ever-changing energy involved in each lightning bolt renders lightning power harvesting from ground-based rods impractical: too high and it will damage the storage; too low and it may not work. Additionally, lightning is sporadic, and therefore energy would have to be collected and stored; i...

Lightning consists of a huge amount of energy. Lightning occurs too quickly. If there were a blockage in the path of the lightning energy, then it would destroy the equipment. The above points represent the challenges of harvesting lightning energy, which harvesting technology has not yet implemented.

Third, the energy contained in a lightning bolt disperses as it travels down to Earth, so a tower would only capture a small fraction of the bolt's potential. In the end, barring the development of a technology that could capture the energy from lightning before it strikes, it's probably best to focus on other, more earthly sources of energy.
